concentrated liquidity for the lazy (and everyone else)

yet-to-be-named automated rebalancing vaults — live on Stellar testnet

PITCH STEP 01 / 07

THE PROBLEM

CL turned Stellar LPs into order managers.

► CL positions earn only while price sits inside the tick band — drift out and the position earns nothing AND holds 100% of the losing token.
The only fix on Stellar today: a manual withdraw → swap → deposit routine where one bad execution costs more than days of fees.

Real Aquarius testnet position — 20 XLM, range 4.48–4.95, price at 5.57 → fees $0. Manually babysitting CL positions is a pain in the ass.

👉 We lived it: on a real testnet rebalance, one route quoted ~38% off fair price — our on-chain price bound reverted it. A manual LP would have eaten the loss.

PITCH STEP 02 / 07

THE SOLUTION

Deposit either pool token, hold shares, withdraw to either or both — one tx each way.

► The strategy contract owns the Aquarius CL position; a keeper automatically rebalances it when price drifts out of range — inside strict on-chain policy. You never touch a band again.
Zap-in/out: a deposit accepts either token and a withdraw can pay out a chosen split — swap+deposit batch atomically, one tx.
LP fees and AQUA rewards compound back into the share price.
It's a platform: third-party strategists run their own rebalancing templates and earn the operator fee leg.

👉 **One transaction in · one transaction out · no ranges, no bundles, no trigger config.**

STELLAR COMPOSED

Three protocols composed — plus a layer given back.

► DeFindex — OtterSec-audited vault + factory: custody, shares, roles (our own factory instance; vault_fee pinned 0).
Aquarius — concentrated pools hold the managed position.
Reflector — oracle referees every price: balance(), swap minimums, staleness gates. Never the pool's own spot.
Back to the ecosystem: first CL strategy for DeFindexTrait + P1/P2 vault bugs found, patched and disclosed upstream.

👉 **DeFindex custody × Aquarius liquidity × Reflector referee — the textbook composed build.**

TECHNICAL WORKFLOW

How a keeper rebalance runs — and why it can't hurt you.

► A keeper proposes each rebalance; the contract re-checks it against stored limits and Reflector prices — keeper numbers are never trusted.
Unwind → swap → re-mint is one atomic transaction — a rebalance can't land half-done.
Swap routing is purpose-built for the rebalance step — the residual leg is routed for maximum swap efficiency.

👉 The contract itself re-checks every keeper action against 14 stored limits — rival vaults check far fewer (Charm: 5, Gamma: none — it trusts the owner).

PROGRESS & PROOF

The whole share-token + platform layer shipped this weekend.

► New this weekend: six contracts live on Stellar testnet — strategy, registry, platform, routing, test scaffolding. Verified on-chain: create → deposit → harvest → withdraw; harvest really deployed a CL position, converted rewards and skimmed the fee — hashes in DEPLOYMENTS.md. Tested hard: 28 scenario tests + real-vault end-to-end, 37 audit warnings → 0, fuzzing clean — plus a replay of the real mainnet pool and oracle from a chain snapshot.

👉 **Disclosed prior work: offchain CL rebalance algo → PoC vault (Oct 2) — everything else is new.**

MARKET & ROADMAP

The vault shape that won everywhere — ported to Stellar.

► Won on Solana + EVM; Stellar's open slot.
Model: capped cut of position income, split platform/operator; the vault fee stays at 0.

Next: extensive testing → Sushi adapter → mainnet live-fire → Axis orderbook MM vaults → keeper bounties → SCF.

THE TEMPLATE LIBRARY — 5 FAMILIES

re-center-on-exit — re-mint the band on drift

inventory-ratio — hold an asset mix (live!)

peg-anchored — stable pairs, median peg

signal-driven — off-chain vol-scaled plans

no-swap reuse — park leftover, never sell

VENUES ON THE ROADMAP

AQUARIUS
live on testnet

SUSHI V3
adapter next

AXIS
orderbook MM vaults

THE BUILDER

One builder — and a disclosed AI toolchain.

► Trond — years of market making with synt.tech on the Stellar DEX; already operating automated CL rebalancing with an offchain algo. Architecture & security decisions.
AI tooling disclosed: Devin SWE-2 Max agents for research, code, tests, docs and deck/video assets — OMP DeepSeek V4.1 Flash 1017 + Kimi 3.1 for code auditing.

👉 **Repo · testnet deployment · demo video — links in the submission. Judges: ask me anything on Discord.**
